

About Korean Medecine :

Although traditional Korean medicine (TKM) has been influenced by traditional Chinese medicine (TCM), It has developed distinctive features. Around the 15th century, Western medical books were introduced to Korea and Koreans started to develop their own medical system.

The Dongui Bogam is a Korean book compiled by the royal physician Lee Si-do, published in 1613 during the Joseon period of Korea. It marked a turning point in the establishment of a Korean medical system independent of TCM. TKM emphasizes the specific characteristics of each individual suffering from the disease, rather than a single symptom.

Come meet our Korean colleagues who are coming this year to France after organizing the last Icmart conference in Jeju, South Korea

Recent studies on TKM have demonstrated its therapeutic effects and link to genetic variations. Clinical and genetic studies on TKM pharmacogenomics.
